

The Internet\Remixed

An Open Atlas of the spatial eXtRaNET

by

PAACHUTECH

Location-enhanced application browsing

XR-native framing for all apps and websites!

Andrew Byrne

Pachakutech Design and Development San Francisco, CA

Industry leaders and independent creatives benefit by seamless, shared access to local commerce

1. Problem

The Internet is experienced through a 2D grid interface and came into being before smartphones allowed apps to travel with their users. At first it consolidated practices while diversifying services, but then—coincident with the smartphone home screen’s revival of the desktop—that rich, interconnected ecosystem condensed into a few, large “Walled Gardens”.

Immersive 3D experiences (Augmented, Mixed, or Virtual Realities—called XR) are the canary in the coalmine: they are poorly framed by Mobile, Web—even XR!—app launchers and struggle with visibility:

- Jarring transitions from grid-based layouts to fluid 3D worlds.
- Relevant experiences are only discovered when the right app is installed and opened.
- To run multiple experiences, one must keep a set of complex mental maps in their head.

That unfriendly interface with XR is a symptom of a bigger issue: the application market is crowded with options and yet many struggle to find connections to the daily life of their market. e.g.: an EV driver selects from 1 of 5+ apps after they have parked at a charger, Pokemon Go players do not see public transit information, and small businesses are alienated from search algorithms!

A solution must broaden app discoverability and also user control, moving past 2 dimensions even on small wearables. Nourishing an ecosystem instead of acquiring one, betting on—not against—technological & market evolutions, it must be a thin, focused, trusted horizontal layer that will rehydrate the market by linking large services and locally connected independent creatives in a human-friendly index.

2. Solution: An Atlas of the XR net

An **open, spatial internet**—the intersection of http, location awareness, and immersive experience—is the answer: Just as http+html allowed anyone with a browser to enjoy the internet, Pachakutech’s eXtRaNET Atlas—the specification, architecture, and implementation layer of that spatial internet—unifies experience browsing so that cognitively friendly tools like search, location indexing, history and favorites can be applied across applications, expanding access while increasing relevance.

Visual registration is but one component to immersion; Pachakutech’s eXtRaNET Browser uses multimodal access and an AI+XR kernel to provide immersive spatial computing for all applications—while automating application browsing through compelling, intuitive UI innovations¹:

- **Markers** appear on a 2D map and in our XR mode as hyper-bubbles: spherical carousels by which users preview & subscribe to **Experiences** available at that location—focusing & diversifying application discovery.
- **Spatial UI**: Walking or zooming into a hyper-bubble loads that **Marker**’s data & functions for all subscribed **Experiences** by positioning **Artifacts** at their registered geolocations and linking **Actions** to them.
- **Multimodal discovery**: At **Markers**, haptic(vibratory) notifications may launch subscribed **Experiences** using the eXtRaNET Browser or third-party **Applications**.
- **Horizontal Access**: Independent creators thrive outside the walled gardens which crave their input; with individuals, innovators and incumbents sharing a discovery plane, the eXtRaNET Atlas allows niche and mainstream creators to coexist in a unified perspective that is managed by the end-user.

Our browser is not the only home for the eXtRaNET Atlas: other applications can use our API and/or visual metaphor to use locations as a deep-link. Mirroring **Artifacts**, we provide **Actions**—and for the organization of **Markers** we provide **Quests**; in the appendices we explore how both eXtRaNET Browser-native and third-party apps can use these features while promoting our browser.

This new internet topography extends multimodal, location-focused experience discovery across all devices—wearables, phones, goggles and Autonomous Vehicles—for all apps. By allowing users to control Experience subscription, and tying the data (**Artifacts**) & functions (**Actions**) of those Application/Experiences to locations (**Markers**), browsing now leverages seemingly inexhaustible human **place-memory** for navigation authority.

Seen another way, the Atlas puts bookmarks “on the map”, allowing us to share & browse them in XR.

To be credibly universal, the eXtRaNET must be independent from the major players and also flexible enough to address the entire market—authentic horizontalism is the path by which apps of all varieties can be discoverable in XR, regardless of hardware. Building the ecosystem by facilitating the patterns of the last evolution—walled garden BBSs into webrings and favorites lists—we seek to claim the endgame of the XR geolocation protocols with our Atlas: the “DNS” of an **open, spatial internet**.

¹See pgs 1, 4, 6 8 & 9

The XR market is crowded--and thats a good thing!

Pachakutech's eXtRaNET Atlas Taps the Ecosystem!

Browsing the eXtRaNET Atlas

Users swipe & tap hyperbubbles to preview & load the XR content—Artifacts—at a Marker

Experiences are supported by XR Applications in many-to-one relationships

Camera feed gently introduces users to AR presence and frames each Experience in an XR metaphor

Markers group Artifacts by Experience

Artifacts of eXtRaNET Experiences are updated by domain owners—who can further represent their brand using Quests, Actions, Events & Tickets

Controls remain consistent in map and native XR browsing

Users may select or subscribe to Experiences for automated Artifact loading and haptic notifications that can directly launch XR Applications

Pachakutech offers hosting and sandbox tools for smaller content creators and a customizable "at home" Marker for individual users

3. Market Opportunity

The AR market was ~\$120 billion in 2025 and is projected to reach \$1.05 trillion by 2033 (CAGR 29.7%). Broader XR (AR+VR+MR) follows similar explosive trajectories, with location-based and immersive advertising as the highest-engagement vectors. Pokémon GO alone has generated >\$6 billion lifetime revenue (still ~\$550 million annually) while driving foot traffic—proof that geospatial XR turns passive locations into commerce engines—yet today’s experiences remain siloed in single apps, too hierarchical for the creator ecosystem to scale geometrically.

Our cross platform eXtRaNET Browser also addresses the adjacent **casual & mobile gaming market** (~\$150 billion in 2026 revenue, growing at ~10% CAGR). By enabling spatial presence in mobile games, augmented realities and even websites, we aggregate these audiences rather than competing in isolated apps. The result is a new discovery layer for thousands of ad experiences, games (zombie survival, roadside pinball, interactive quests, etc.), tourism, retail, and local commerce—driving real-world engagement for the entire market.

Recalling that web browser based applications helped unify development practices, we aim to demonstrate a few examples of successful Atlas & Browser-backed XR experiences—at first ourselves and then with a studio subsidiary. The “Undead Digest”² employs a viral marketing scheme which introduces technical creatives to the possibility of serving local commerce & also the infrastructure to branch out on their own.

TAM/SAM/SOM: Discovery + aggregation across location aware and location agnostic spatial applications represent a market slice in the hundreds of billions of dollars that scales with hardware (smart glasses + phones) and 5G/edge computing. Our lightweight structure only requires a small slice of this large, dynamic market: \$4-80 million/year in 2-4 years through creator tools—and scaling profits in the long-term through geospatial & trend intelligence tools. Our initial gaming campaign is easier to forecast: TAM of the mobile gaming + XR + retail media markets is \$200-400B, a conservative SAM of \$5-15B and SOM of \$8–30 million annual revenue within 3–5 years.

Initial Focus: Develop a viral, country-wide gaming experience² with GUI creator tools while populating our servers by scraping the entire ecosystem of popular immersive application endpoints; **then:** national rollout by using that gaming campaign’s success to inspire regional business innovations on well traveled routes, domain owners to evolve the default shortcuts from our scraping work, and all parties to deep-link to our browser for an XR-native application alert & entry.

4. Business Model

Pachakutech stays deliberately small and focused: a lean, AI-structured company built around a handful of senior experts (including freshly retired Google specialists). The core eXtRaNET infrastructure—protocol servers, DNS system, XR endpoint scraping, & the intuitive, ad-free browser with cutting-edge UI—remains entirely within Pachakutech. Since the necessary horizontalism will not be credibly prioritized within a big vertical, Pachakutech + other partners invest in subsidiary Partner Studios to capitalize on commercial opportunities using the eXtRaNET. The “Undead Digest” game is a bridge between these models: it introduces users to the new browser & serves as a proof-of-concept for studio investments—not the primary product of Pachakutech.

Instead: ad, gaming, & branded experiences are built by *existing companies & partner studios*³ using our Atlas infrastructure, browser XR engine &/or our pay-for creation tools to link, promote &/or support their products. Pachakutech keeps the core browser ad-free with creator tools, ad intelligence & crowdsourced spatial surveys, its costs small due to constrained *technical* scope, and the market’s choice clear by its clarity of purpose.

Primary revenue comes from:

- **XR Hosting + Creation Lab:** Our sandbox provides “SiteBuilder” tools & hosting for independent creatives to build with; browser-native XR, Quest personalization, and easy publication evolves users into developers.
- **Monetizable Trends:** Anonymized personalized targeting, contextual mapping and spatial surveys.
- **Partner Studios:** Fast-moving studio investments pursue XR market verticals with browser-native apps as well as XR Atlas-brokered collaborative “happenings” by which cities, venues & enterprises drive foot traffic.

This model creates network amplifications:

better user access → more commerce → more experiences → more users → more commerce.

²see appendix 1 for the details of a multi-vendor level design and marketing campaign

³A small team of “cracked” younger creatives is available to create browser-native Experiences in a higher-risk venture of which Pachakutech will be the strategic investor and anchor customer.

5. Current Stage & Key Milestones

Where we are: Working server + client prototype complete. Liquid-glass UI and multimodal discovery already demonstrated. Small team in formation; two senior experts (retired) ready to join.

Key Milestones (next 18 months):

1. Q3 2026: Assemble core teams + close initial expert advisors; begin endpoint scraping.
2. Q4 2026: Closed beta in Bay Area (100+ test users, >90% market coverage).
3. Q2 2027: First demonstration of vertical⁴ 10+ partners from existing market.
4. Q4 2027: Open beta + partners surge ecosystem with 4+ apps; first hosting/creation-lab revenue.
5. 2028: Launch Ad Intelligence and Spatial Surveys; 100K+ MAU and repeatable revenue.

6. The Ask

We seek **smart, connected capital** from an investor who understands the strategic importance of an **open spatial internet**. We favor a modest check paired with deep domain expertise and relationships that help us scale independently while navigating big-tech dynamics.

Funds will support minimal team expansion, creation of the multi-vendor game, creation of the sandbox GUI, initial content scraping&seeding, and building early partnerships—preserving our lean, independent structure while sponsoring browser-native innovation.

In Pachakutech, are not chasing a huge round to hire aggressively—we are building the foundational rails for the next internet, one focused on everyday commerce through multimodal immersive experience. We will welcome a broad array of partners in Pachakutech's subsidiary studios.

Marker spawning in our XR browser is a natural fit for in-car app discovery.

⁴see: Appendix 1

Appendix 1: UnDead Digest

A case study in hyper-viral multi-vendor XR marketing to be made by Pachakutech

Pachakutech will develop UnDead Digest(UDD) to refine developer components and demonstrate profitability.

Early GMs are found by asking local taskrabbits to put up flyers about money-making opportunities for mad genius scientists in the upcoming zombie invasion.

GMs are self-motivated to provide further local promotion; UDD supplies them with materials to post around town regarding zombie danger and the Digest's zombie tracking solution.

A shop owner who uses our game to drive traffic to our store is a welcome persona; so is the technical artist who builds a competing game using Pachakutech's Atlas or components: Undead Digest aims to cultivate a new "last mile": regional technologists serving local business!

Early seeding + flyering by touring musician friends.

After verification, GMs can add the square mile they are in to their portfolio if it is uninfected; this allows them to position game peices, share in the revenue generated and to establish local partnernerships for game traffic in that square mile.

UDD uses the spatial authorship tool from the XR Atlas sandbox for bespoke level design: GM places a Marker (to be rendered in the FPS XR view, not the game's map) where the player should begin the scene and then Artifact origins are set from that position; game guidelines indicate a few zombies go near a bar, several near a gas/EV station, many near a vaccine drop site atop a car park.

GMs select local shops for reciept-scan powerups, gathering intelligence in this new market. We partner with Pepsi or Coke for a time-regulated logo scan powerup.

Game Master Invitation (Seen when outside an "infected" zone)

Application populates its map with Artifact preview resources from the eXtRanet Atlas.

Game uses Pachakutech Atlas resource hosting to store 3D resources indexed by Artifact.

Co-op play occurs by Actions updating hosted objects indexed by Artifact; Atlas servers remain unchanged.

Visibility of Artifacts (changed by e.g. drone operation) is controlled by eXtRanet Atlas Tickets.

Game tests for eXtRaNET browser by schema, prompts install for XR experience.

When players approach the location of Markers, the Atlas SDK delivers notifications for all subscribed experiences as per usual; UDD is the only App-with-Experience they have installed yet, so it will be the only one subscribed.

Users see sparse Digest updates about zombie activity.

Once bitten, if w/o vaccine, gameplay is locked. Another player can revive the character via NFC vaccine, but the vaccine drop has many zombies nearby. This can be "hacked" by having a new player install the game near the drop.

Players scan store receipts to get unique game objects e.g. garlic, messenger bag of holding, recon drone.

EV stations recharge equipment batteries (used for drone scans, lighting flamethrower, decoys).

Players collect bottles by eliminating zombies near bars & bodegas, but can only hold a few.

Fuel Stations Fill Bottles to make Molotov Cocktails, which are a core microtransaction item.

Player Screen

(Seen when gamepeices are present)

UDD launches Atlas browser in XR mode; Player walks into the Marker Bubble to "load the level" i.e. the Atlas + browser will place Artifact origins per GM design for the UDD Experience alongside any other permitted Marker artifacts. Users *could* browse other experiences at this point, but the game action is timed.

Player dispatches zombies in a noisy manner, risking continued waves; it might have been better for them to use or buy a Molotov from the notification! Both play styles introduce players to the potent intersection of personal location and haptic signals.

Marker proximity causes app-specific haptic (vibration) pattern & a notification w/action items; user can use a Molotov for a silent kill or risk a fracas by entering the FPS game.

Game loads all Marker artifacts in XR Browser
Tickets allow hidden game peices to be rendered

eXtRaNET Actions notify UDD's game server

Choosing to fight launches XR browser-native FPS component

Appendix 2: A Few Other Uses

Grave:
A roadside memorial service

Customers select and customize memorials for passers-by

When Users click on memorials, the Artifact's Action opens a separate app in which to view an obituary and media regarding the deceased as well as other historical events in the area mentioned in memorials

Memorials will be kept for individuals for some several years after the last payment.

Markers cause artifacts to be loaded and unloaded from the XR view.

(existing) Ikea Place:
Users checkout w/delivery without breaking XR

Atlas Location Ownership provides property owners with a Home Marker; this bundles a ready-made personal sandbox for XR house control with anti-doxxing protection and allows XR shopping apps to complete transactions without reverting to 2D menus.

Users take tours of historically significant locations to view and take selfies within an AR overlay of archival media and historical recreations

Users must obtain a Ticket in order to load the relevant Markers and Artifacts

This Experience uses Quests to guide the user to an ordered set of locations.

At Home
Personal XR Sandbox

(existing) iTrails
Tours with historical overlays

Atlas Experience selection extends to link any XR experience to another—even in other applications!

Local Creators developing bespoke products for brick-and-mortar business act independently as "forward engineers" of the eXtRanet Atlas. Here, someone has created a ballistic bird game which advertises itself as an icon on Markers that are located on the road. The marker we are about to drive over will add an Artifact of another app the user has subscribed to and possibly change the state of the bird game.

(existing) VR games

Mere guardsmen, players equip themselves to either collect resources or shield themselves, sponsoring battle-cruisers and drop-ships to attack opposing territories.

Collab with longtime Starcraft "casting" Canadian duo for game design.

Regional battlemaps appropriate for strategizing and casting show materiel & resource movement.

Planetary Guardsman A horizontal presentation of ALL XR products on smart phones or as a full-screen projection in an AV
A mobile-first RPG
